ConditionalInferenceTrees & Kaplan-Maeier Predict Heart Failure Survival Time

Antonio Pano

11/4/2022

https://archive.ics.uci.edu/ml/datasets/Heart+failure+clinical+recorc (https://archive.ics.uci.edu/ml/datasets/Heart+failure+clinical+recor

- All 299 patients had left ventricular systolic dysfunction

Initial Variables:

- age: age of the patient (years)
- anaemia: decrease of red blood cells or hemoglobin since last measure (boolean)
- high blood pressure: if the patient has hypertension (boolean)
- creatinine phosphokinase (CPK): level of the CPK enzyme in the blood (mcg/L)
- diabetes: if the patient has diabetes (boolean)
- ejection fraction: percentage of blood leaving the heart at each contraction (percentage)
- platelets: platelets in the blood (kiloplatelets/mL)
- sex: woman or man (binary)
- serum creatinine: level of serum creatinine in the blood (mg/dL)
- serum sodium: level of serum sodium in the blood (mEq/L)
- smoking: if the patient smokes or not (boolean)
- time: follow-up period (days)
- [target] death event: if the patient deceased during the follow-up period (boolean)

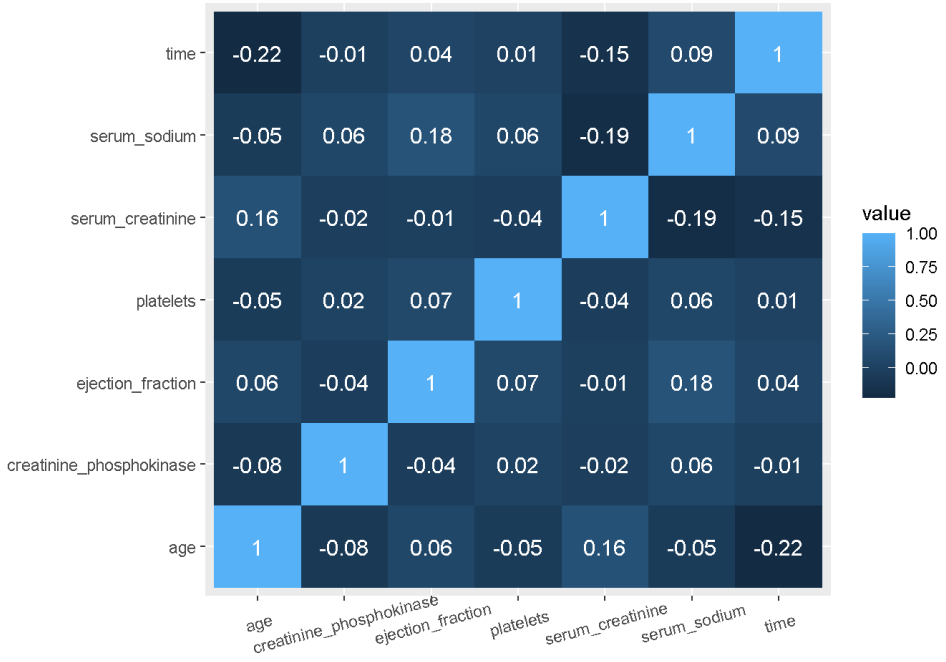
Correlation

Time and Serum_Creatinine have a correlation to Serum_Sodium of 0.15 & 0.19, respectively.

```
cormat <- HF %>% select(where(is.numeric)) %>% cor() %>% round(2)
melted_cormat <- reshape2::melt(cormat)

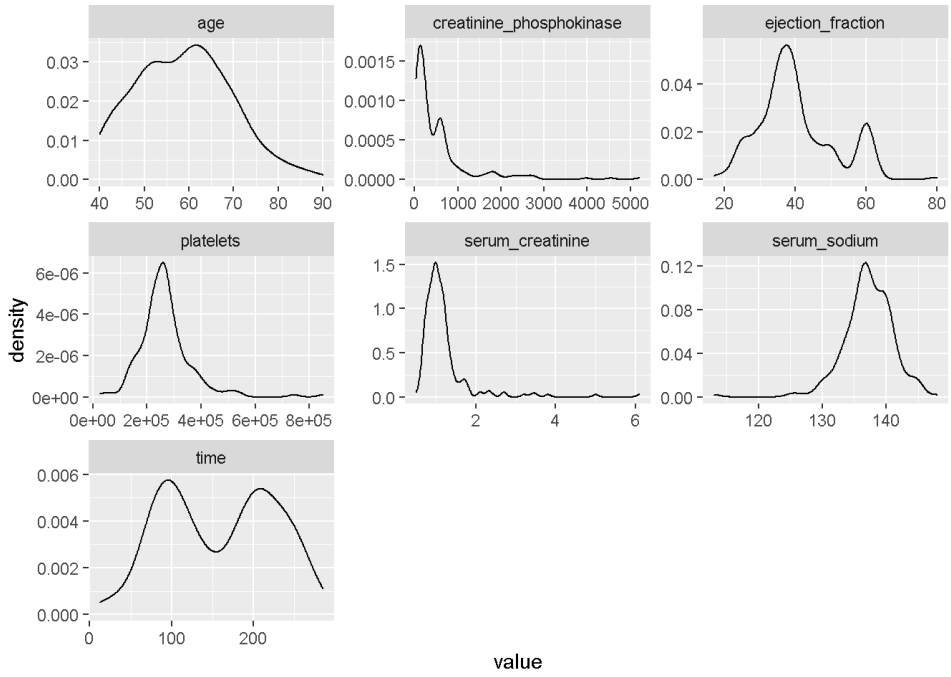
ggplot(data = melted_cormat, aes(x=Var1, y=Var2, fill=value)) +
  geom_tile() +
  geom_text(aes(Var2, Var1, label = value), color = "white", size = 4) +
   theme(axis.title.x=element_blank(),
        axis.title.y=element_blank(),
        axis.text.x = element_text(angle = 15, vjust = 0.8)
        )
```



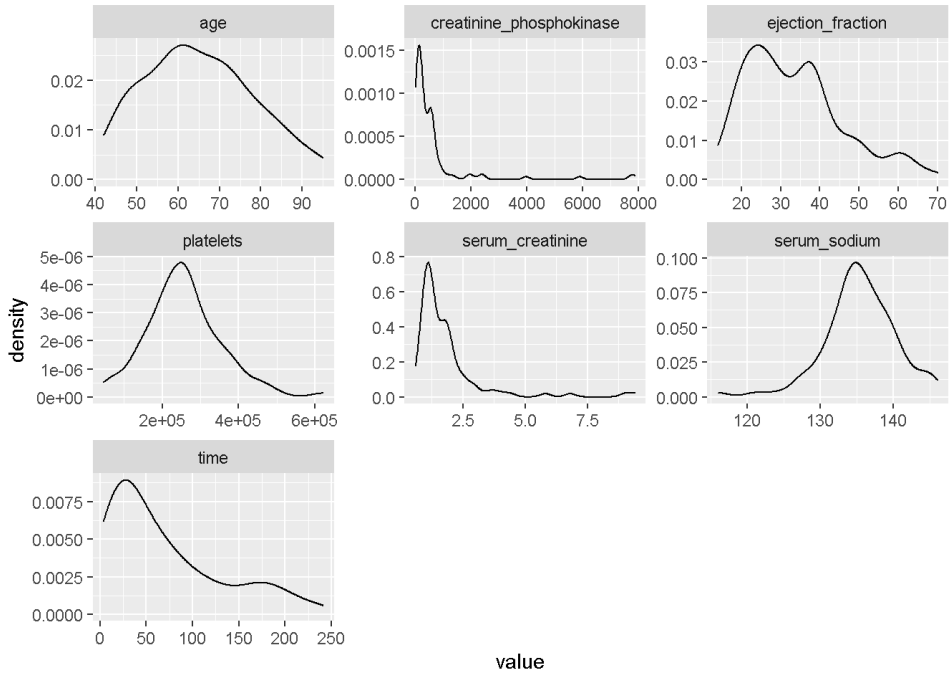
Choosing to grab distributions based on having hypertension– what's traditionally seen as a good indicator of heart failure.

Doing so to look at, specifically, Ejection Fraction right after to see if there is correlation.

```
HF %>% filter(DEATH_EVENT==0) %>%
  purrr::keep(is.numeric) %>%
  gather() %>%
  ggplot(aes(value)) +
    facet_wrap(~ key, scales = "free") +
    geom_density()
```



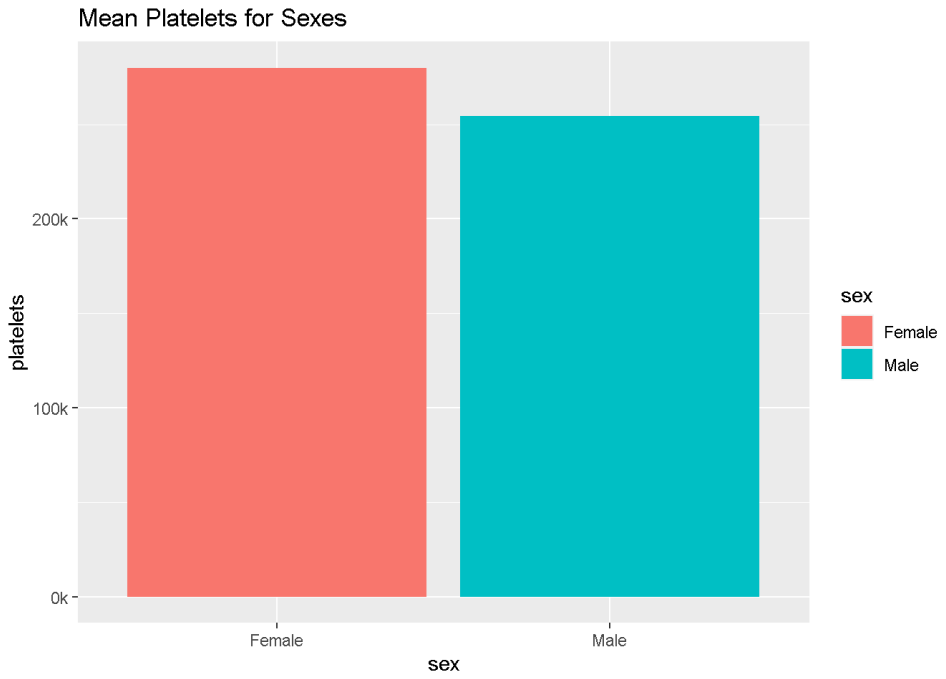
```
HF %>% filter(DEATH_EVENT==1) %>%
  purrr::keep(is.numeric) %>%
  gather() %>%
  ggplot(aes(value)) +
    facet_wrap(~ key, scales = "free") +
    geom_density()
```



Comparing `creatinine_phosphokinase` to Men & Women– those who smoke and those who do not.

- Noticing that the average `creatinine_phosphokinase` is higher for non-smokers.

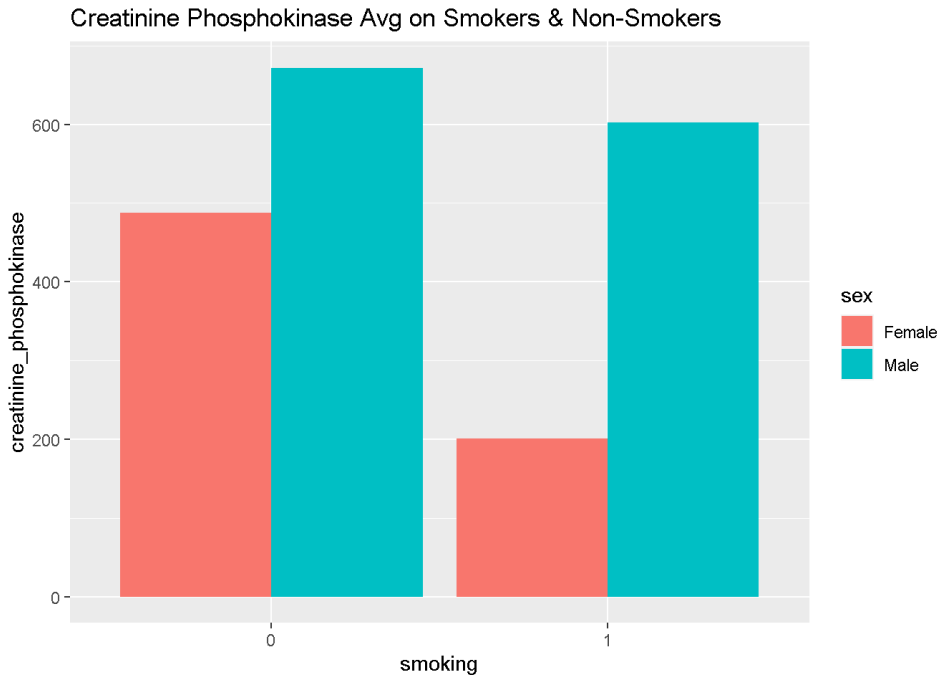
```
ggplot(HF, aes(x=sex, y=platelets, fill=sex)) +
  geom_bar(position = "dodge", stat="summary", fun="mean") +
  scale_y_continuous(labels = scales::label_number(suffix = "k", scale = 1e-3)) +
  ggtitle("Mean Platelets for Sexes")
```



```
HF %>% group_by(sex, DEATH_EVENT) %>%
  summarize(count = n(), .groups="drop")
```

```
## # A tibble: 4 × 3
##   sex    DEATH_EVENT count
##   <fct>  <fct>       <int>
## 1 Female 0              71
## 2 Female 1              34
## 3 Male   0             132
## 4 Male   1              62
```

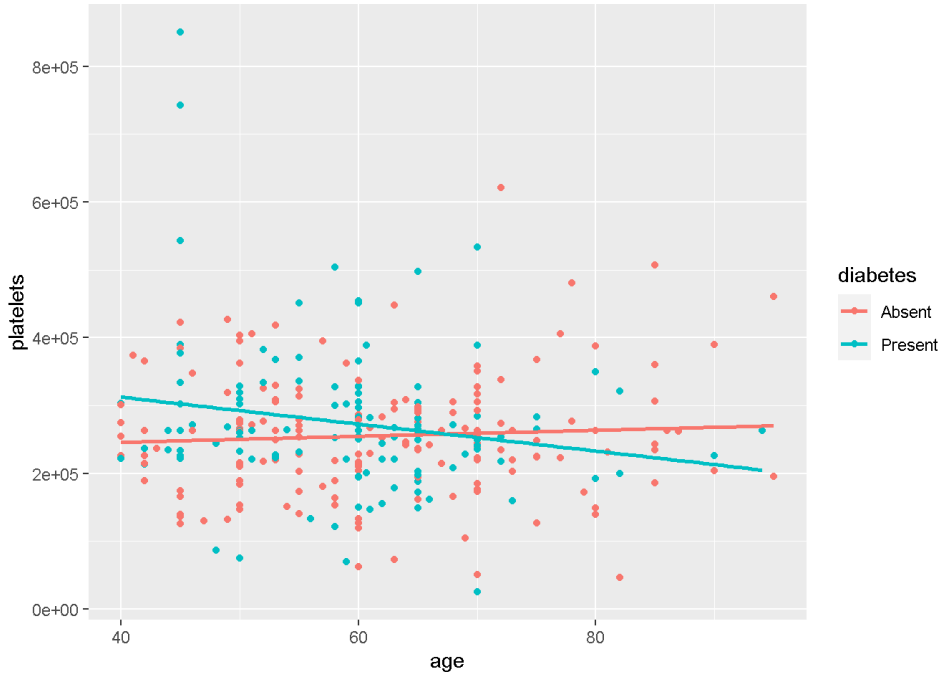
```
ggplot(HF, aes(x=smoking, y=creatinine_phosphokinase, fill=sex)) +
  geom_bar(position = "dodge", stat="summary", fun="mean") +
  ggtitle("Creatinine Phosphokinase Avg on Smokers & Non-Smokers")
```



- Finding out that for those diabetic, plateletes are ensured to reduce as you age.
- For those who aren't diabetic, plateletes generally stay the same and potentially, increase by a marginal amount.

Plateletes are incredibly important. Having too few plateletes can lead to internal bleeding in intestines or stroke.

```
ggplot(HF, aes(x=age, y=platelets,color=diabetes)) + geom_point() +
  geom_smooth(method='lm', se = FALSE)
```



Kaplan - Maeier Curve

We can see we have remaining cases in which the person did was not declared deceased due to the ending of the curve not dropping down to 0%.

Insights from this graph include: * `Serum Creatinine` is highly significant with the showcased split at 1.8 for survival prediction.

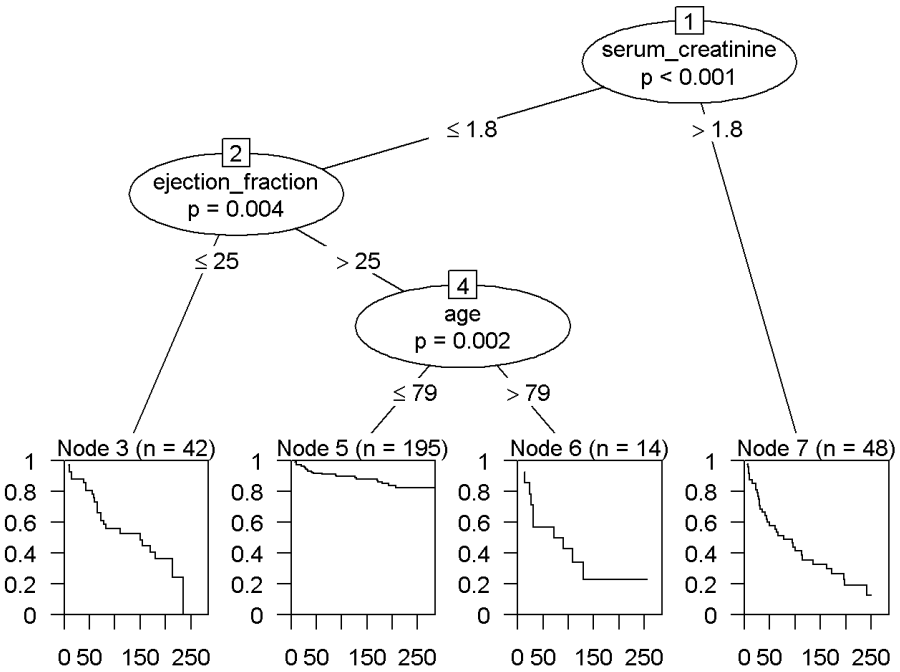
```
set.seed(0)

# Won't directly go from factor to numeric. Needed for Survival Analysis.
HF$DEATH_EVENT = as.numeric(as.character(HF$DEATH_EVENT))

# Dropping categorical Ejection Fraction.
HF <- HF %>% select(-EF_Condition)

# Creating a Conditional Inference Tree for descriptive analytics
CondInfTree <- ctree(Surv(time, DEATH_EVENT) ~ .,
                     data = HF)

plot(CondInfTree)
```

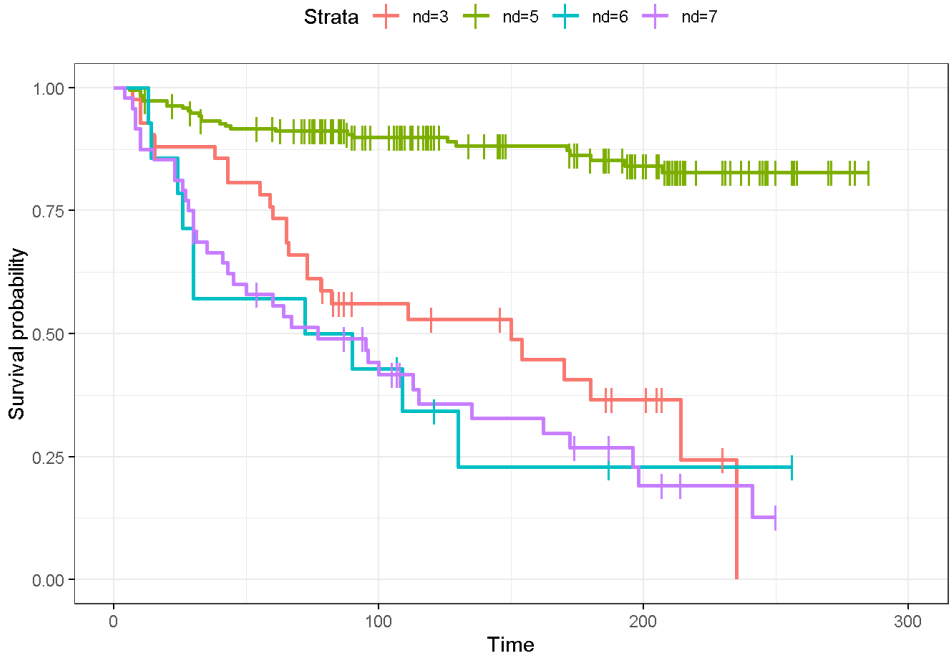


Plotting all node distributions/curves in one plot.

```
nd <- factor(predict(CondInfTree, type = "node"))

all_nd <- survfit(Surv(time, DEATH_EVENT) ~ nd, data = HF)

ggsurvplot(all_nd, data = HF,
           censor.shape="|",
           conf.int = FALSE, #surv.median.line = "hv",
           ggtheme = theme_bw())
```



Constructing an exponential curve for previous graph's second node. * 24% probability of survival after t=130 days for patients older than 79, that have less than or equal to 1.8 in serum creatine, and an ejection fraction over 25.

```
K <- HF %>%
  filter(serum_creatinine <= 1.8, ejection_fraction > 25, age > 79)

# This one is best.
# The ~ 1 is our way ofletting R know that we aren't using any x variables. Just time and whether event occured which are both
 y variabes.
pred_k_surv <- survfit(Surv(time, DEATH_EVENT) ~ 1, data = K)

Cox Proportional Hazards Model (Cox Regression)

KM will make the curve based on event & time but that's all. We need to include the rest of the variables.

- At a given instance in time, someone who has hypertension is 0.42 times as likely to die as someone without hypertension adjusting for age.
- At any given instance in time, someone who does *not* have hypertension is 0.65 times as likely to die as someone who does, adjusting for age.
- Concordance: Goodness of fit for survival analysis.

```

```

Performing the Log-Rank Test on the `hypertension` & `diabetes`.

- Finding out that the distribution of present hypertension is statistically significant when compared against the distribution of the absence of it.
- The presence of diabetes, however, does not impact survival rate.

```
#Hypertension
ggsurvplot(survfit(Surv(time,DEATH_EVENT) ~ hypertension, data=HF),
           data = HF,
           censor.shape="|",

```

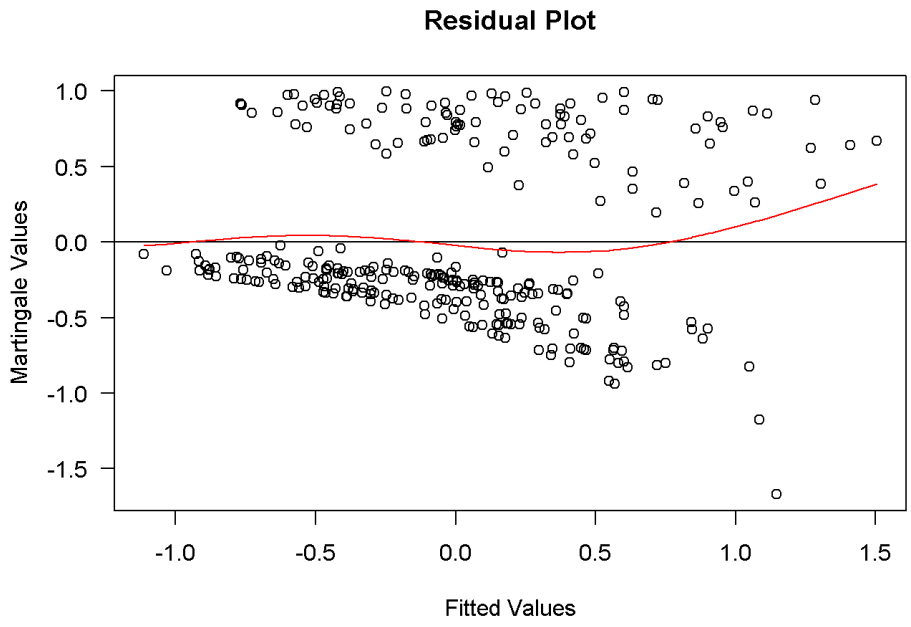
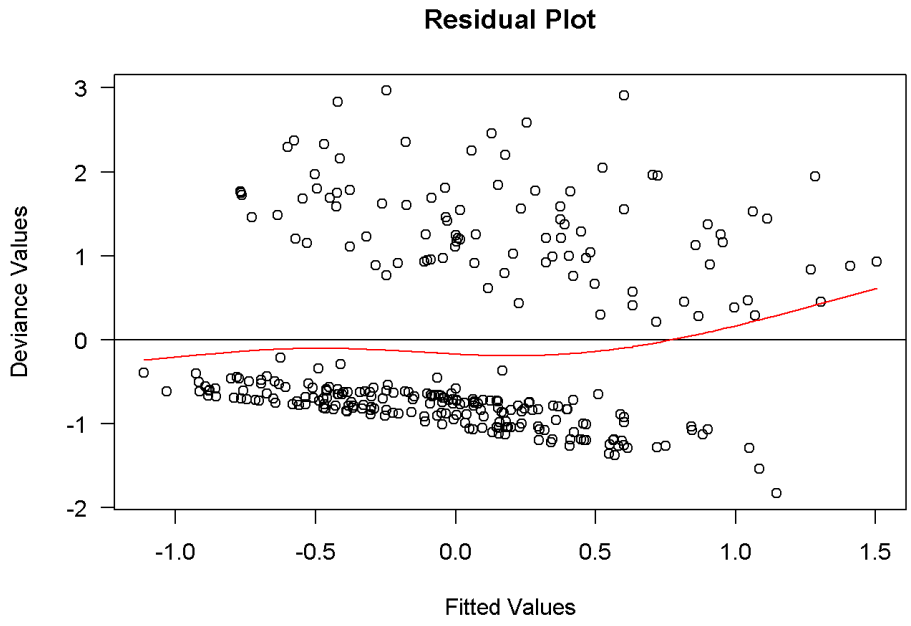
Checking Linearity of Model DO THIS AT THE VERY END!!!

```
# Checking Linearity using MARTINGALE residuals.
# Should be as linear as possible.
plot(predict(coxMod1), residuals(coxMod1, type = "martingale"), xlab = "Fitted Values",
     ylab = "Martingale Values", main = "Residual Plot", las = 1) +
  abline(h=0) +
  lines(smooth.spline(predict(coxMod1), residuals(coxMod1, type="martingale")), col="red")
```



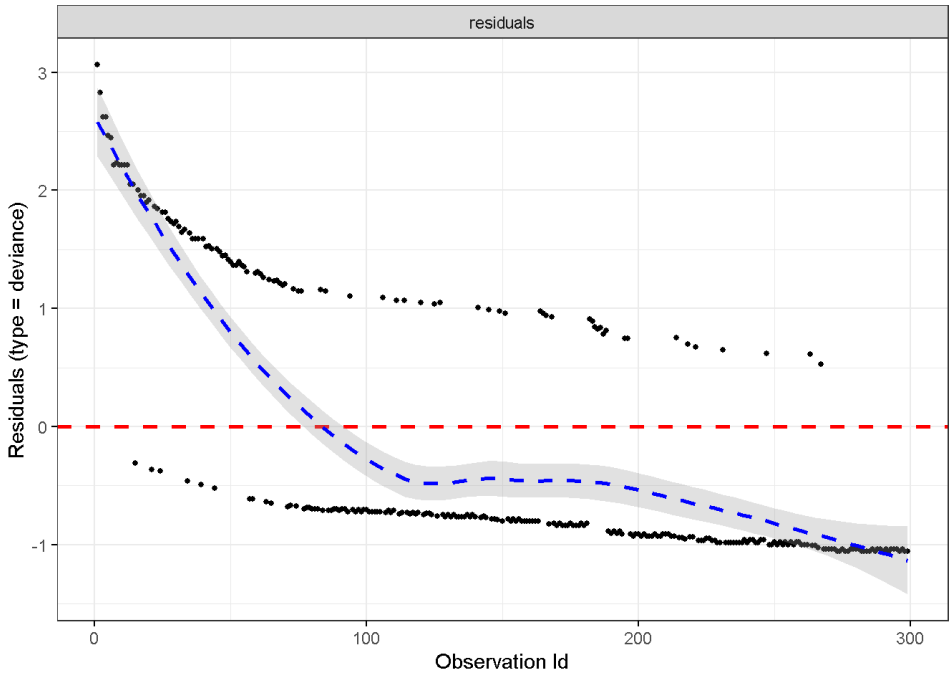
```
## integer(0)
```

```
# Same thing using deviance residuals
plot(predict(coxMod1), residuals(coxMod1, type = "deviance"), xlab = "Fitted Values",
     ylab = "Deviance Values", main = "Residual Plot", las = 1) +
  abline(h=0) +
  lines(smooth.spline(predict(coxMod1), residuals(coxMod1, type="deviance")), col="red")
```



```
## integer(0)
```

```
#NO IDEA WHAT THIS DOES BUT IT'S USEFUL, I THINK
ggcoxdiagnostics(coxMod2, type = "deviance",
                 linear.predictions = FALSE, ggtheme = theme_bw())
```



NEXT STEPS: CHECK PRESENCE OF LINEARITY FOR COX REGRESSIONS. BUILD A LOGISTIC MODEL FOR PREDICITONS RIGHT AFTER, PERHAPS.
