Conditional Inference Trees & Cox Regression to Predict Heart Failure Survival Time

Antonio Pano 11/10/2022

https://archive.ics.uci.edu/ml/datasets/Heart+failure+clinical+record (https://archive.ics.uci.edu/ml/datasets/Heart+failure+clinical+record

• All 299 patients had left ventricular systolic dysfunction

Initial Variables:

- age: age of the patient (years)
- anaemia: presence of critically low haematocrit levels (boolean)
- high blood pressure: if the patient has hypertension (boolean)
- creatinine phosphokinase (CPK): level of the CPK enzyme in the blood (mcg/L)
- diabetes: if the patient has diabetes (boolean)
- ejection fraction: percentage of blood leaving the heart at each contraction (percentage)
- · platelets: platelets in the blood (kiloplatelets/mL)
- sex: woman or man (binary)
- serum creatinine: level of serum creatinine in the blood (mg/dL)
- serum sodium: level of serum sodium in the blood (mEq/L)
- smoking: if the patient smokes or not (boolean)
- · time: follow-up period (days)
- [target] death event: if the patient deceased during the follow-up period (boolean)

Loading in the data

Creating Left Ventricular Ejection Fraction Groups set by Cardiology Experts (https://www.ncbi.nlm.nih.gov/books/NBK459131/). Rounding for averages instead of only using data for men and women.

```
HF <- read.csv("heart_failure_clinical_records_dataset.csv")

HF$anaemia = as.factor(HF$anaemia)
HF$diabetes = factor(HF$diabetes,levels=c(0,1),labels=c("Absent","Present"))
HF$hypertension = factor(HF$high_blood_pressure,levels=c(0,1),labels=c("Absent","Present"))

HF$sex = factor(HF$sex,levels=c(0,1),labels=c("Female","Male"))
HF$smoking = as.factor(HF$smoking)
HF$DEATH_EVENT = as.factor(HF$DEATH_EVENT)</pre>

HF <- select(HF, -high_blood_pressure)

skim(HF)
```

Data summary

Name	HF
Number of rows	299
Number of columns	13

Column type frequency:	
factor	6
numeric	7
Group variables	None

Variable type: factor

skim_variable	n_missing	complete_rate ordered	n_unique top_counts
anaemia	0	1 FALSE	2 0: 170, 1: 129
diabetes	0	1 FALSE	2 Abs: 174, Pre: 125
sex	0	1 FALSE	2 Mal: 194, Fem: 105
smoking	0	1 FALSE	2 0: 203, 1: 96
DEATH_EVENT	0	1 FALSE	2 0: 203, 1: 96
hypertension	0	1 FALSE	2 Abs: 194, Pre: 105

Variable type: numeric

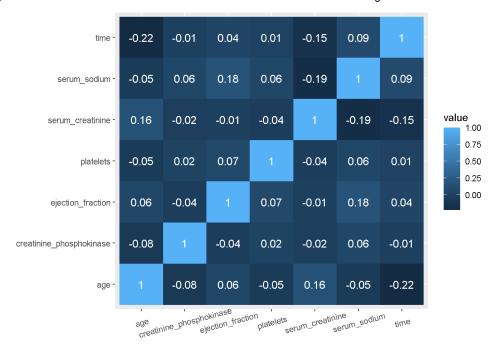

skim_variable	n_missing	complete_rate	mean	sd	p0	p25	p50	p75	p100	hist
age	0	1	60.83	11.89	40.0	51.0	60.0	70.0	95.0	
creatinine_phosphokinase	0	1	581.84	970.29	23.0	116.5	250.0	582.0	7861.0	-
ejection_fraction	0	1	38.08	11.83	14.0	30.0	38.0	45.0	80.0	_=
platelets	0	1	263358.03	97804.24	25100.0	212500.0	262000.0	303500.0	850000.0	_=_
serum_creatinine	0	1	1.39	1.03	0.5	0.9	1.1	1.4	9.4	-
serum_sodium	0	1	136.63	4.41	113.0	134.0	137.0	140.0	148.0	
time	0	1	130.26	77.61	4.0	73.0	115.0	203.0	285.0	

Correlation

Time and Serum_Creatinine have a correlation to Serum_Sodium of 0.15 & 0.19, respectively.

```
cormat <- HF %>% select(where(is.numeric)) %>% cor() %>% round(2)
melted_cormat <- reshape2::melt(cormat)

ggplot(data = melted_cormat, aes(x=Var1, y=Var2, fill=value)) +
    geom_tile() +
    geom_text(aes(Var2, Var1, label = value), color = "white", size = 4) +
    theme(axis.title.x=element_blank(),
        axis.title.y=element_blank(),
        axis.title.y=element_text(angle = 15, vjust = 0.8)
    )
</pre>
```

Choosing to grab distributions based on having hypertension- what's traditionally seen as a good indicator of heart failure.

Doing so to look at, specifically, Ejection Fraction right after to see if there is correlation.

```
HF %>%

Creatinine Phosphokinase Avg on Smokers & Non-Smokers

- Finding out that for those diabetic, plateletes reduce as age increases.
- For those who aren't diabetic, plateletes generally stay the same and potentially, increase by a marginal amount.

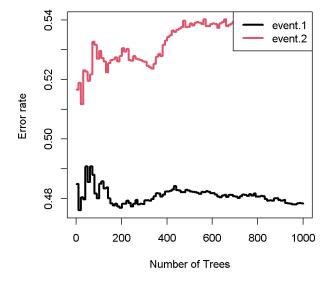

Plateletes are incredibly important. Having too few plateletes can lead to internal bleeding in intestines or stroke.

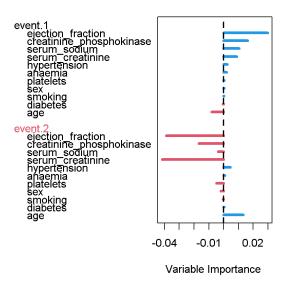

```

Conditional Inference Trees - Kaplan Meier Curves

We can see we have remaining cases in which the person did was not declared deceased due to the ending of the curve not dropping down to n%

Insights from this graph include: * Serum Creatinine is highly significant with the showcased split at 1.8 for survival prediction.

Plotting all node distributions/curves in one plot.

```
# Extracting survival curve for only one observation from the ctree. Perhaps an outlier.
#nd1 <- predict(CondInfTree, type = "prob")[[10]]
#summary(nd1, times=c(20, 45, 60, 80, 100, 10*(11:15)))
```

Constructing an exponential curve for previous graph's second node. * 48% probability of survival after t=150 days for patients older that have less than or equal to 1.8 in serum creatine, and an ejection fraction under 25.

```
K <- HF %>%
  filter(serum_creatinine <= 1.8, ejection_fraction <= 25)

# This one is best.
# The ~ 1 is our way ofletting R know that we aren't using any x variables. Just time and whether event occured which are both y variabes.
pred_k_surv <- survfit(Surv(time, DEATH_EVENT) ~ 1, data = K)
summary(pred_k_surv, times=c(20, 45, 60, 80, 100, 10*(11:15)))</pre>
```

```

- No pruning was done since most trees found revolve around the same 3 variables.
- Probability of survival after 150 days for those younger than 70 is 77%.
- Probability of survival after 200 days for those younger than 70 is 70%.

200 Day Survival (95% CI) For Those Younger

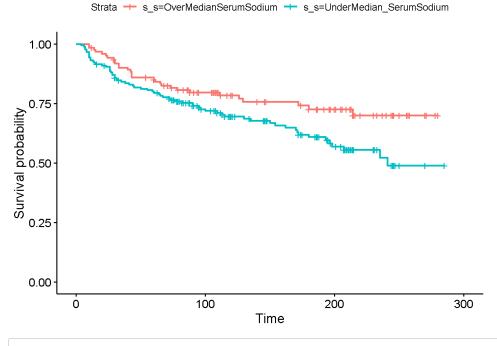

```
survfit(Surv(time, DEATH_EVENT) ~ 1, data = HF %>% filter(age <= 70)) %>%
tbl_survfit(
  times = c(150,200),
  label_header = "**{time} Day Survival (95% CI) For Those Younger Than 70**"
)
```

Characteristic Than 70 200 Day Survival (95% CI) For Those Younger Than 70 Than 70 Overall 77% (71%, 82%) 70% (64%, 77%)

Looking at Serum Sodium Splitting at the median in case this dataset has any bias bc of outliers. * Finding that those with higher serum sodium have better survival rates, on average.

```
survfit(Surv(time, DEATH_EVENT) ~ 1, data = HF %>% filter(creatinine_phosphokinase <= 70)) %>%
tbl_survfit(
  times = c(150,200),
  label_header = "**{time} Day Survival (95% CI) For Those Younger Than 70**"
)
```

Characteristic	Than 70	Than 70		
Overall	72% (57%, 90%)	72% (57%, 90%)		
ss <- HF %>% mutate(s_s = ifelse((se	erum_sodium <= median(serum_sodium)), "UnderMed	dian_SerumSodium", "OverMedianSerumSodium"))		
ss_fit <- survfit(Surv(t	ime, DEATH_EVENT) ~ s_s, data=ss)			
ggsurvplot(ss fit, data :	= 55)			

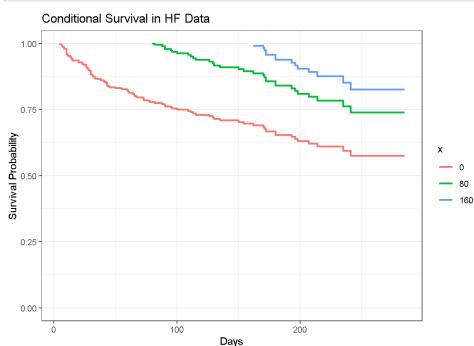

150 Day Survival (95% CI) For Those Younger

#CLEARLY, HAVING HIGHER SERUM_SODIUM MEANS HIGHER RATE OF SURVIVAL.

```
remotes::install_github("zabore/condsurv")
library(condsurv)

fit1 <- survfit(Surv(time, DEATH_EVENT) ~ 1, data = HF)

   )</pre>
```

Cox Proportional Hazards Model (Cox Regression)

KM will make the curve based on event & time but that's all. We need to include the rest of the variables.

- At a given instance in time, someone who has hypertension is 0.42 times as likely to die as someone without hypertension adjusting for age.
- At any given instance in time, someone who does not have hypertension is 0.65 times as likely to die as someone who does, adjusting for age.
- · Concordance: Goodness of fit for survival analysis.

```
# hypertension useful bc tree didn't output it. i paired it w/ age bc why not?
coxMod2 <- coxph(Surv(time, DEATH_EVENT) ~ hypertension + age, data=HF)

Findings:

- At a given instance in time, someone who has hypertension is 0.42 times as likely to die as someone without hypertension adjusting for age.
- Probability of survival after 150 days for those younger than 70 is 77%.
- Probability of survival after 200 days for those younger than 70 is 70%.
- 24% probability of survival after t=130 days for patients older than 79, that have less than or equal to 1.8 in serum creatine, and an ejection fraction over 25.

- For those diabetic, plateletes seem to reduce as age increases.
- On average, creatinine_phosphokinase is higher for non-smokers.
- Men, on average, have higher creatinine_phosphokinase.
- Women, on average, have a higher platelets count.
- age, ejection fraction, the presence of hypertension, and a value of serum creatinine greater than 1.25 are the variables that contribute most to an accurate prediction of mortality.
- age, creatinine_phosphokinase, ejection_fraction, serum_creatinine, and the presence of hypertension are what most impact the survival rate probability.
- · anemia, smoking, sex status, and diabetes, and are the fields that contribute the least to survival rates, in that order.
